AB The preparation of butane 2,3-diacetal protected glycolic acid and related systems is described together with highly selective alkylation reactions of (R,R) and (S,S)-butane diacetal protected glycolic acid. These compds. are readily deprotected to give enantiopure α-hydroxy acids, α-hydroxy esters or α-hydroxy amides by suitable choice of conditions. The stereoselective synthesis of (5S,6S)-5,6-dimethoxy-5,6-dimethyl-1,4-dioxan-2-one (acetal) (I) was reported. The stereoselective alkylation of I with (bromomethyl)benzene gave (3R,5S,6S)-5,6-dimethoxy-5,6-dimethyl-3-(phenylmethyl)-1,4-dioxan-2-one (II). Ring opening and deprotection of II gave (αR)-α-hydroxybenzenepropanoic acid Me ester (III).

AB Benzyloxycarbonyl (Z)-protected glycine equivalent I has been prepared in enantiopure form and has been used in the synthesis of both α-substituted amino acids and α,α-disubstituted amino acids. The process involved deprotonation to form the corresponding enolates which underwent stereoselective alkylation with various electrophiles and upon hydrolysis gave the corresponding amino acid derivs. as enantiomerically pure products.

II

AB A novel series of 6-hydroxy-3-morpholinones I [R1 = Me2CH, Me2CHCH2, PhCH2; R2 = Ph, PhCH2, 2-naphthyl, 4-MeOC6H4, 4-BuOC6H4, 4-(cyclohexylmethyl)phenyl], in which the functional aldehyde and the hydroxy group of P2 site form a cyclic hemiacetal, was identified as calpain inhibitors. The placement of iso-Bu group at the 2-position of the 3-morpholinone (R1) was the most effective modification for inhibiting
μ- and m-calpains. Substitutions of benzyl at the 5-position in the S-configuration had virtually no effect on inhibitory activity. Several compds. showed appreciable selectivity for calpains over cathepsin B.
NMR
expts. demonstrated that (S,S)-I (R1 = Me2CHCH2; R2 = Ph) (SNJ-1757) was more stable to nucleophilic attack than the corresponding aldehyde inhibitor II. Furthermore, (S,S)-I (R1 = Me2CHCH2; R2 = Ph) proved to have better corneal permeability than II in an in vitro experiment

I

AB Compds. represented by the following general formula (I) (wherein R1 and R2 each represents optionally substituted lower alkyl) or salts thereof are prepared The compds. I or salts thereof have potent calpain inhibitory

L6 ANSWER 6 OF 35 CAPLUS COPYRIGHT 2006 ACS on STN (Continued)

activity and are useful for the treatment and prevention of calpain-related diseases such as ischemia, immune diseases, Alzheimer's disease, osteoporosis, diseases caused by brain tissue disorders, cataract, glaucoma, retinochoroidal disease, posterior eye complex caused by photocoagulation, and diseases accompanied by neovascularization. Thus, (1S)-1-(2-dioxolanyl)-2-phenylethylamine 15, L-leucic acid 10, 1-hydroxybenzotriazole 12, and Et3N 8.6 g were dissolve din 120 mL DMF, treated with a suspension of 16 g 1-ethyl-3-(3-dimethylaminopropyl)carbodiimide hydrochloride in 40 mL CH2Cl2 under ice-cooling, and stirred at room temp. for 18 h to give, after workup and crystn. from EtOAc, 75% (2S)-N-[(1S)-1-(2-dioxolanyl)-2-phenylethyl]-2-hydroxy-4-methylpentanamide (II). To a soln. of 2.0 g II in 150 mL THF was added 150 mL aq. HCl and stirred at room temp. for 18 h followed by workup and purifn. using HPLC (YMC-Pack ODS-A column) to give 29% (2S,5S)-5-benzyl-6-hydroxy-2-(2-methylpropyl)-3-morpholinone (III). III and (2S,5S)-5-(4-biphenylmethyl)-6-hydroxy-2-(2-methylpropyl)-3-morpholinone showed IC50 of 0.70 and 0.25 μM against μ-calpain, resp., and 0.93 and 0.36 μM against m-calpain, resp. Pharmaceutical formulations, e.g. an injection soln. contg. III, were described.

AB A new chiral glycine equivalent I (Z = benzyloxycarbonyl) has been synthesized from glycidol using a chiral memory protocol and its use in the synthesis of N-Z protected α-amino acids was demonstrated in a series of diastereoselective lithium enolate alkylation reactions and subsequent acid hydrolyzes.

AB The bulk drug, paclitaxel, a potent antitumor agent, is isolated from the bark of the pacific yew tree, Taxus brevifolia. Another naturally occurring taxane, cephalomannine, is difficult to sep. from paclitaxel due to structural similarities. However, cephalomannine can be selectively oxidized in the presence of paclitaxel using ozone. Subsequently, the oxidized cephalomannine can be separated from paclitaxel by conversion to a water soluble Girard hydrazone, followed by liquid/liquid extraction All previously described methods for separation of paclitaxel and cephalomannine, or cephalomannine derivs., have required difficult and potentially expensive chromatog.

AB The title compds. are prepared by treatment of I or its derivs. with mineral acids. Thus, to 10 g. I in 100 ml. MeOH and 10 g. CuSO4 was added dropwise 0.0826 mole H2SO4 and the mixture refluxed 1 hr. and distilled with steam to yield 42.6% ROMe (through the abstract R = CH2:CMeCO) and 8.7% ROH, while 35% solid II separated in the condenser. To 10 g. II was added 0.065 mole H2SO4 and 0.118 mole MeOH and the mixture heated 20 min. in an autoclave at 170° and refluxed 1 hr. to yield 79% ROMe and 17% ROH. To 10 g. Me2C(C.tplbond.N)OCMe2CO2H was added 0.065 mole H2SO4 and 0.118 mole MeOH and the mixture heated 20 min. at 150° to yield 37.2% ROMe and 14.5% ROH. Similar heating of O(CMe2CO2H) with H2SO4 and MeOH afforded 11.5% ROH and 11.1% ROMe.

AB The primary OH-group of chloramphenicol reacts with isocyanatocarboxylic acid esters R1CH(N:CO)(CH2)xCO2R2 (I) to give (chloramphenicolcarbamido)carboxylic acid (A) esters. Thus, 160 ml. pyridine and 129 g. Et isocyanatoacetate were added to a suspension of 323 g. chloramphenicol in 1l. AcOEt to give a clear solution After 40 hrs. at room temperature the precipitate was filtered off with suction, washed with ether, and dried to give 325 g. Et (chloramphenicolcarbamido)acetate (II), m. 138-40°. Addnl. 53.3 g. II were obtained from the filtrate after extraction of the pyridine with dilute HCl and concentration of the pyridine-free solution NaOH (2N, 115 ml.) was added dropwise to a suspension of 100 g. II in 300 ml. EtOH. After 10 hrs. at room temperature the clear solution was concentrated in vacuo, diluted with H2O, and acidified with diluted HCl to precipitate the acid. The precipitate was filtered off, washed with H2O and dried to give 80.7 g. (chloramphenicolcarbamido)acetic acid, m. 150-3°, Ca salt m. 160-5°, Na salt m. 120-30°, dibenzylamine salt m. 153-6°, dibenzylethylenediamine salt m. 112-16°. Similarly obtained were (isocyanatocarboxylic acid ester used, m.p. of the corresponding A acid ester, m.p. of the A acid, and salts given): Me L-α-isocyanato-γ-methylmercaptobutyrate, 171-2.5°, 141-4°, -; Me DL-α-isocyanato-γ-methylmercaptobutyrat, 115-40°, 132-6°, -; Me D-α-isocyanato-γ-methylmercaptobutyrate, 145-6°, oil, -; Me L-α-isocyanatoisocaproate, 133-4°, 120-5°,-; Me DL-α-isocyanatoisocaproate, oil, oil, Na 145-8°; Me DL-α-isocyanatoisovalerate, oil, oil, Na 142-4°; Et DL-α-isocyanatopropionate, 160-2°, 205-6°, -; Me DL-α-isocyanato(phenyl)acetate, 176-7°, amorphous, Na 166-70°; di-Me L-α-isocyanatoglutarate, 151-2°, 117-25°, -; di-Me L-α-isocyanatosuccinate, 153-4°, oil, -; Me ε-isocyanatocaproate, 104-6°, oil, -; Me L-isocyanatoisocapoate 133-4° (EtOH), 86-8° (EtOH-H2O), Na 135-40°, dibenzylamine salt m. 160-5°, dibenzylethylenediamine salt m. 198-201° (EtOH) Ca 173-6°; Me D-isocyanatoisocaproate 78-80° (EtOH-H2O), dibenzylamine 189-91°, dibenzylethylenediamine 183-5° (EtOH-H2O). The new derivs. give stable aqueous solns. or suspensions, their toxicity is lower

AB The title compound (I) was prepared as the K or Na salt, by treating 4-nitroso-2,2,5,5-tetramethyl-3-oxotetrahydrofuran (II) in benzene or toluene with water in the presence of KOH or NaOH as catalyst. Further hydrolysis yields α,α'-dicarboxydiisopropyl ether (III). Operating with lower amts. or in the absence of catalyst yields IV, which could be also esterified. Operating in pyridine, in the presence of benzenesulfonylchloride yields V. Thus, equimol. amts. II and 25% KOH were refluxed 10-15 min., cooled, shaken with Et2O, and the aqueous phase slowly mixed with an equimol. amount HCl, while cooling, and extracted with Et2O. The extract was dried, and evaporated in the cold at slightly reduced pressure, to give raw I (yield 81%), which was recrystd. to give I, m. 72.5° (ligroine). Further refluxing of I until NH3 formation ceased, and neutralization with 1 mole HCl, gave III (yield 80%), which recrystd. gave III, m. 158° (water or C6H6). II (98.8%) (0.0585 mole) in 40 g. toluene and 0.2 g. NaOH were refluxed 2 hrs., and evaporated in vacuo to give IV (yield 48%). Recrystn. from 1% HCl, gave another 37% IV. Benzenesulfonylchloride (0.22 mole) was added dropwise to a solution of 0.2 mole II in 100 g. pyridine at 80°, while stirring, to give V (yield 80.5%), m. 156° (Me2CO). I and III are used in the production of polyesters and polyamides, and IV and V in the production of formaldehyde resins.

AB cf. CA 59, 15279b. The rearrangements of α-halo ketones to branched acids by basic reactants have been studied (Tchoubar, CA 50, 9283i). Anionic migration of the functional H in halo aldehydes produces an unbranched α-acid. The effects of the presence of alcoholates and of NH3 on Favorskii transpositions of α-chloroisobutanal were investigated. A suspension of alkali alcoholate acted on the chloroisobutanal to form an isobutyric ester as well as the epoxy ether. A suspension of NaNH2 caused the same rearrangement with the formation of isobutyramide. The same metallic amide in solution in liquid NH3 led to a heterocyclic compound of the morpholine type. Expts. were made on α-chloroisobutanal with NaOMe and LiOMe, iso-PrONa and tert-BuONa, with and without the presence of the corresponding alcohols, with NH4Cl, and with NaCl + NH3 in the presence of liquid NH3 and of ether. Products were analyzed by gas chromatography and by infrared spectrometry. The reaction of α-chloroisobutanal with Na methylate by the method of Stevens (S., et al., CA 49, 8804d,. S. and Gillis, CA 51, 16477a) yielded about 20%, Me isobutyrate without alc. and only traces with alc. Me isobutyrate, b. 93°, was obtained in 23-g. yield by treating 7 g. Li suspended in 1 l. Bu2O with 70 g. chloroisobutanal in 100 cc. Bu2O at 0° and refluxing for 3 hrs. The yield of the isopropyl ester from 1.07 moles iso-PrONa and 1 mole aldehyde was about 20% without alc. and a trace with alc. In the latter case, 30 g. diisopropyl acetal of α-hydroxyisobutanal b15 76-8°, n23 1.4140, was obtained. In all cases, the Favorskii rearrangement seemed to be linked to a heterogeneous reaction. It corresponded to the benzilic mechanism (T., loc. cit.). Negatively charged O formed by nucleophilic addition at the carbonyl group of the group B (either MeO- or NH2-) as well as the neg. α-substituent, chlorine, was attracted by the pos. centers of the surface of the reactive solid containing cations. An anionic migration of H permits replacement of the Cl, with formation of R2CHCOB-. The same type of primary addition of the anion B at the carbonyl in a homogeneous medium permits favorable orientation of neg. O in an antiparallel position with respect to the Cl and the isolation of an epoxide for B = MeO-. With B = NH2- a more complex evolution leads to other derivs.

AB 2-Amino alkanonitriles (I), having at least 3 C atoms, were effective nematocides. These compds. can be divided into several sub-groups. The simplest members of the class of nematocidal agents are alkylsubstituted I, e.g., α-methyl-α-(methylamino)-propionitrile, which can be prepared by treating acetone cyano-hydrin with MeNH2. The second subgroup is the group of N- substituted poly(cyanoalkyl) alkylene polyamines, e.g., N,N'-bis(1-cyanoethyl)ethylenediamine, which can be prepared by treating lactonitrile with ethylenediamine. The third subgroup is N-substituted (cyanoalkyl) alkoxyalkylamines. N-(1-Cyano-ethyl)ethoxyethylamine can be prepared by treating lactonitrile with ethoxyethylamine. The fourth subgroup is α-substituted piperazinealkanonitriles, e.g., α,α,α',α'-pentamethyl-1,4-piperazinediacetonitrile, which can be prepared by treating acetone cyanohydrin with 2-methylpiperazine. The fifth subgroup is α-substituted morpholinealkanenitriles, e.g., α-methyl-4-morpholineacetonitrile, which can be prepared by treating lactonitrile with morpholine. The sixth subgroup is α-substituted aceto-nitrile derivs. of bis(2- or 3-aminoalkyl) ethers of poly(oxyalkylene)polyols, e.g., bis [N-(1-cyanoethyl)-3-aminopropyl] ether of polypropylene glycol which can be prepared by treating polypropylene glycol with acrylonitrile in the presence of a basic catalyst to produce a bis(cyanoethyl) ether of polypropylene glycol, catalytically hydrogenating the latter to produce a bis(3aminopropyl) ether of the polypropylene glycol, and treating the latter with lactonitrile to give the nematocidal agent. This compound has an average mol. weight of 400. The nematocidal agents can be utilized in any conventional manner, as in soil application by spraying, drenching, or dusting. Superior results were obtained in subsoil applications when the nematocidal agents were introduced into the soil to a depth of ≤6 in. These nematocidal agents can be embodied in dusts containing carrier or fillers, as well as in liquids, and can be applied together with fertilizers, insecticides, fungicides, and (or) herbicides.

AB In general, the 3,5-morpholinediones were prepared from the suitably substituted esters of glycolic acid by converting them to diesters of diglycolic acid, then to the diamides or ammonium salts which were pyrolyzed to the substituted 3,5-morpholinediones. Preliminary pharmacol. screening tests indicated that compds. with like substituents possess similar activities as hypnotics and anticonvulsants. NaNH2 (19.5 g.) in 300 cc. Et2O treated dropwise under reflux with 66 g. Et α-hydroxyisobutyrate, refluxed 2 hrs., H2O added, the dried Et2O layer distilled, the 23 g. of product, b13 125-8°, dissolved in 25 cc. liquid NH3 in 175 cc. alc., the solution heated 5 days at 70-80° in a pressure bottle, and the solution concentrated gave 15.4 g. α,α-dimethyldiglycolamide (I), m. 162-3° (alc.). I (14.3 g.) heated 0.5 hr. at 200°/60 mm., the temperature raised to 260°, and the mixture distilled at 20 mm. gave 6.3 g. 2,2-dimethyl-3,5-morpholinedione, m. 74-6° (C6H6-ligroine). NaH (2.4 g.) in 100 cc. C6H6 treated during 25 min. with 16 g. Et α-ethyl-α-hydroxybutyrate, stirred 40 min., 18.4 g. BrCH2CO2Et added dropwise, the mixture refluxed 2 hrs., H2O added, and the organic layer dried and distilled gave 9.2 g. oil, b22 152-7°. A total of 90.7 g. of this oil in 340 cc. hot HCl heated 16 hrs. on the steam bath gave 41.5 g. α,α-diethyldiglycolic acid (II), m. 146-8° (EtOAc). II (28.5 g.) in 90 cc. NH4OH evaporated to dryness, the salt heated 25 min. at 190° at 50 mm., the bath temperature raised to 210°, the pressure lowered to 14 mm., and the product distilled gave 10.4 g. 2,2-diethyl-3,5-morpholinedione, m. 62-3° (iso-PrOH-H2O). Ethylphenylhydroxyacetic acid (11.4 g.) refluxed 2.5 hrs. with 60 cc. MeOH containing 0.3 cc. H2SO4, the mixture treated with 50 cc. H2O and 50 cc. saturated NaHCO3, the solution saturated with NaCl, extracted with Et2O, and the aqueous layer worked up gave 11.1 g. Me ethylphenylhydroxyacetate (III), b0.9 86-8°, n25D 1.5080. III (18.8 g.) added dropwise during 2 hrs. to 1.9 g. NaH in 200 cc. C6H6 at room temperature, stirred 6.5 hrs., refluxed 1.5 hrs., at room temperature, treated with 13.4 g. BrCH2CO2Et, refluxed 1 hr., treated with 100 cc. H2O, neutralized, and the C6H6 layer washed with NaHCO3 gave 14.7 g. Me α-ethyl-α-phenyl-α-carbethoxymethoxyacetate (IV), b0.7 133-5.5°, n25D 1.4945. IV (4.2 g.) in 100 cc. MeOH saturated with dry NH3 at -5° in a pressure bottle, left 1 week at 45-55°, and the solvent removed gave a quant. yield of α-ethyl-α-phenyldiglycolamide (V), m. 175° (MeOH-Et2O) (decomposition). V was pyrolyzed at 210-20° to give an amber oil; this oil in hot MeOH treated with C, and the filtrate treated with H2O gave 0.67 g. 2-ethyl-2-phenyl-3,5-morpholinedione, m. 124-5° (MeOH-Et2O).

AB cf. C.A. 7, 3110; 20, 2673; 21, 3051. A correction. The products of the reaction of PhCH: CHCH(OH)CONH2 with cold NaOH solution are shown to be 6-phenyl-4-hydroxy-4-carbamyl-3-benzyl-2-oxohexanoic acid (I), PhCH2CH2C(OH)(CONH2)CH(CH2Ph)COCO2H, and its diamide (II) instead of the previously reported PhCH2CH2C(OH)(CONH2)OC(OH)(CO2H)CH2CH2Ph and its diamide. The reaction products of I with various reagents must be accordingly corrected Thus, at 100° I loses 1 mol. H2O to give the lactone (III) which forms a thiosemicarbazone, m. 222°; I, II, and III heated in alkaline medium decompose into NH3 and PhCH2CH2COCO2H (IV). I with KMnO4 gives α-hydroxy-α-phenethyl-β-benzylsuccinimide (V), m. 120°, which on boiling with strong bases decompose into a mixture of IV and PhCH2CH2CO2H. V with Na2CO3 gives the succinamic acid which with Ac2O at 100° yields first α-hydroxy-α-phenethyl-β-benzylsuccinic anhydride, m. 104°, and then α-phenethyl-β-benzylmaleic anhydride, m. 75°. Treating I with HCl in AcOH gives both diastereoisomeric lactones, m. 120° (VI) and 82° (VII), resp., of the 6-phenyl-4-hydroxy-3-benzyl-2-oxohexanoic acid (VIII); VI with bases yields a mixture of PhCH2CH2CHO and IV, while VII forms an acid, m. 142° (probably VIII), which on heating rearranges to α-phenethyl-β-benzylsuccinic anhydride, m. 74°. All the substituted hydroxysuccinic anhydrides previously reported (cf. P. Cordier, C.A. 24, 4284) must be replaced by the corresponding maleic anhydride derivs.

AB cf. C. A. 28, 3714.5, 5408.6. A detailed study has been made of the different varieties of dilactylic acid (I) in order to compare the properties and stability of the various isomers and to obtain the optically active modifications. The crude mixture of isomeric acids was prepared by the action of MeCH(ONa)CO2Et on MeCHBrCO2Et (II) according to the method of Jungfleisch and Godchot (C. A. 1, 2683). A solution of 245g. of freshly distilled MeCH(OH)CO2Et, [α]D -4.80°, in 300 g. of rigorously dried Et2O was added slowly to 46 g. of Na wire in a well-cooled flask provided with a Hg valve. At the end of the reaction, 262 g. of II, prepared from MeCHBrCOBr (Ber. 20, 2026(1887)), in 200 g. of Et2O was added and the mixture was refluxed for 2 h. on the steam bath. The cooled mass was extracted with H2O and the dried Et2O layer was evaporated and distilled through a 1-m. Vigreux column, yielding, on redistn., 520 g. (75%) of crude di-Et dilactylate (III) which was saponified, acidified with H2SO4 and extracted with Et2O, producing crude I from which pure (d + l)-acid (IV), m. 112°, crystallized out on standing. The crude acid was separated into IV and the inactive modification (V), m. about 70°, by crystallization of the Mg salt. It was shown that the excess of IV exists in the initial ester III. The tedious separation through the Mg salt was evaded by fractional crystallization of crude dilactylamide (VI) (Compt. rend. 145, 70(1905)) in EtOH which gave, in fine needles, the (d + l)-amide (VII), m. 184°, and the inactive form in rhombic platelets (VIII), m. 136°. Both forms gave IV on saponification with alkalies but, on hydrolysis with N H2SO4, the corresponding acids were obtained. Treatment of the 2 dilactylic esters, (d + l) and (i), with NH3 gave VII and VIII. It was shown that VIII is totally isomerized by the action of alkalies. By heating with a 50% excess of PhNH2 in a sealed tube at 170° for 12 h., III was converted into a mixture of crude dilactylanilides which, on recrystn. from EtOH, yielded (d + l)-dilactylanilide, m. 168°, and the inactive modification, m. 124-6°. Both gave IV on saponification with alkalies but yielded the corresponding acids on hydrolysis with H2SO4. Similarly were prepared the (d + l)- and (i)-p-toluides, m. 179-80° and 145°, with analogous properties. Attempts to sep. the 2 esters from III by fractional distillation at 21 mm. failed on account of the limited range of b. p. of the 2 esters, (d + l), 124.5°, and (i), 128.5°. From the separation effected through the Mg salts and the amides it has been shown that the (d + l)-isomer is 5 times more abundant in III than the

L6 ANSWER 31 OF 35 CAPLUS COPYRIGHT 2006 ACS on STN (Continued)
(i)-modification. Treatment of III or VI with 20% NaOH, neutralization with H2SO4 and extn. with Et2O gave IV, which, on heating with twice the theor. amt. of Ac2O, yielded the (d + l)-dilactylic acid anhydride, m. 36°, b20 108-9° d420 1.2106, nD20 1.44565, M. R. 31.70 (calcd. 31.30). Distn. of a mixt. of IV and PCl5 or SOCl2 gave (d + l)-dilactylic acid chloride, C6H8Cl2O3, b20 85°, reconverted into IV by hydration or by atm. exposure. Treatment of the chloride with EtOH and MeOH produced the esters: Et, C10H18O6, b21 124.5°, d428.1 1.0283, n428.1 1.4140, M. R. 53.12 (calcd. 53.96) , and Me, C8H14O5, b21 113-14°, d428.5 1.0910, nD28.5 1.4157, M. R. 43.75 (calcd. 44.56). IV gave normal Na, K, NH4 and Mg salts. By crystn. in org. solvents VII was spontaneously resolved into its optical antipodes, m. 208°, [α]Hg, ±80°. With H2O, at low temps., a hydrated racemic complex is formed. On heating at 230-40°, VII was transformed by loss of NH3 into the corresponding dilactylimide, C6H9NO3, m. 122° (C. A. 1, 2683). It has been shown that dilactyldiamide in aq. soln. undergoes spontaneous resoln. and a detailed physico-chem. study has been made of this extremely distinct resoln. As a result it has been possible to prep. the active amides in reasonably large quantities and from them to produce, for the first time, the optically active acids and some of their derivs. It is also possible, by the use of strychnine, to resolve IV, provided sufficient recrystns. are made. The biochem. resoln. with the aid of Penicillium glaucum and Aspergillus niger was unsuccessful. Spontaneous resoln. gave VII, [α015]v ±90.22°, changed on heating at 225°, partially to the racemate, m. 184°, and partially to the imide which, under all conditions, proved to be inactive. VII yielded the active acids, m. 88° [α17]v ±126.8°, rotatory dispersion αJ/αV 0.891, αI/αV 1.725. The acid obtained has always the same sign as the generating amide. Treatment of the acid with Ac2O gives the corresponding anhydride (IX) with reversed sign, b20 108-10°, d420 1.2100, nD20 1.44549, [α]V ±18.57°, rotatory dispersion αJ/αV 0.90, αI/αV 1.26. The action of alc. on the active forms of IX gave the active Et esters, b20 123-4°, d428 1.0300, nD28 1.418, [αV19] ±109.27°, αJ/αV 0.881, αI/αV 1.685. Active salts, C6H8Na2O5, [α]D 84.1°, and C6H8MgO5.3H2O, [α]V 20.71° with the same sign as the acids were prepd. From the relations between the signs of the active dilactylic acids and their derivs. and a consideration of the formulas of dilactylic anhydride and the dilactide it follows that the former is a trans deriv. and the latter a cis form. The passage of the acid to these 2 forms is accompanied by a strong augmentation of the rotatory power. Sapon. of VIII with 0.5 N H2SO4 gave an acid, m. 60-5°, which was freed from traces of the accompanying (d + l) -isomers by refluxing for 4 h. with Ac2O and, after removal of the Ac2O, distg. for a short time at reduced pressure. Crystn. of the solidified residue from a mixt. of benzene and Et2O gave pure inactive dilactylic acid, m. 72-3°, which could not be converted into either the anhydride or the chloride since it was not attacked by SOCl2, gave tars on treatment with PCl5 and decompd. on heating. Direct esterification of the acid yielded the Et ester, b21 128.5°, d428.1 1.0251, nD28.1 1.41892, M. R. 53.72 (calcd. 53.96). The normal Na, K and NH4 salts of the inactive acid were prepd. The dilactyldiamide and HgO gave a Hg deriv., regenerating the amide when treated with acids. On heating, the inactive dilactyldiamide gives the (d + l)-dilactylimide but at a much

L6 ANSWER 31 OF 35 CAPLUS COPYRIGHT 2006 ACS on STN (Continued)
lower temp. (180°) than the (d + l) -amide. From a comparison of the (d + l) and inactive dilactylic acids it would seem that the 2 CO2H groups of the (i)-acid are further apart than in the active modifications or at least in a position less favorable to cyclization. With the aid of the above facts plane formulas are proposed to represent the spatial configurations. Some of the exptl.results and generalizations may be applicable to the other homologs of diglycolic acid whose chem. study is yet little advanced.

AB cf. C. A. 20, 1611. The reactions of the diacyl peroxides may be classified into the following groups: 1. Pyrogenic decomposition with elimination of 2 mols. CO2: (RCO)2O2 → 2CO2 + R2; this reaction takes place when the peroxide is heated alone or in a solvent above its m.
p. 2. Reactions according to the R. H. scheme with elimination of 1 mol. CO2 and participation of the solvent: (see structure). 3. Reactions in which a sym. cleavage of the O bridge, without elimination of CO2, occurs:
(RCO)2O2 + 2H → 2RCO2H (hydrogenation, action of secondary amines and of substances sensitive to dehydrogenation, of Grignard reagents and of alkali halides). 4. Reactions in which the diacyl peroxides act like acid anhydrides: (RCO)2O3 + R'NH2 (or HOH) → RCO2OH + R'NHCOR (or RCO2H) (action with H2O, bases, primary amines, alcs. (in the cold), etc.). Naturally, 2 or more of the above types of reactions may occur simultaneously. A new reaction according to the R. H. scheme and further illuminating the general validity of the scheme is reported. Bz2O2 (60.5 g.) refluxed in 150 g. dry cyclohexane dissolves and evolves CO2 for 22 hrs,; distillation now gives 134.0 g. distillate and 63.0 g. residue. From the
residue are obtained 5 g. phenylcyclohexane, b17 80°, b760 239°, solidifies 7°, nD18 1.5274, 5.2 g. BzOH and about 50 g. of a viscous yellow mass non-volatile with steam from which was isolated about 5 g. of p-PhC6CO2H. The distillate yielded 4.6 g. C6H6 (isolated as PhNO2).

AB cf. C. A. 7, 1486. The product of the action of soda on phenyl-α-hydroxycrotonic amide is the amido acid, PhCH2CH2C(OH)(CO2H)OC(CH2CH2Ph)(OH)CONH2, containing an ether grouping as a
result of the dehydration between the hydroxyls of the ketone hydrate group. With KMnO4 it gives an imide (I) and CO2. The reaction is very complex, involving a change in the linkage of the C atoms. I m. 120° and on prolonged boiling with soda, is decomposed into PhCH2CH2COCO2H, PhCH2CH2CO2H and NH3. When dissolved in hot Na2CO3 until there is no turbidity upon cooling, I is hydrolyzed to the corresponding amido acid, (II) or (III), m. 170°. If the hydrolysis is continued with NaOH, the product is the dibasic acid IV, m. 204°. This action is reversible. IV when heated with Ac2O for several min. at 100°, gives an anhydride m. 104° and regenerates IV with alkalies. If the heating with Ac2O is prolonged for several hrs., there is obtained a different anhydride (V) or (VI), m. 75°, isomeric with the first, insol. in cold aqueous Na2CO3 and slightly acid; dissolved in
weak NaOH and acidified with HCl, it regenerates the anhydride itself and not the IV. The Me ester m. 53° and, upon saponification again yields the
anhydride in large part. Na-Hg is without action upon IV, while it reduces the anhydride, yielding a new dibasic acid PhCH2CH2CH(CO2H)CH(CH2Ph)CO2H, m. 170°.
